## **MONTHLY REPORT JULY 1994**

CLIENT : DNMI  
CONTRACT NO. : KCC/PAC004/001  
PROJECT NO. :  
DOCUMENT NAME : RAPPJULY.94  
PROJ. MANAGER : Knut A. Iden  
EXECUTED BY : Bjørn. H. Halvorsen and Knut A. Iden  
APPROVED BY : Bjørn Aune *Bjørn Aune*  
COMPLETION DATE : SEPT. 02 1994  
REV 1. :

DSU : serial no. 6601  
Received : AUGUST 5 1994

Comments regarding the data :

The DSU serial no.6601 contains data for the period 08/7/94 to 03/8/94.

The DSU is read by the standard software (P3059) delivered from Aanderaa a/s. The calibration factors applied is provided by Aanderaa in a fax dated January 21 1994.

The processing is based on this data set and the following steps are conducted :

- . A SAS data set of the data for JULY is generated

In this step 10 min mean wind speed > 35 m/s and gust wind speed > 40 m/s are replaced with missing values. The wind speed in 30 m is also compared to the wind speed measured 18 m above the ground. If deviation is 10 m/s above or 5 m/s below the wind speed measured in 18 m, the wind speed in 30 m is replaced by missing value. The reason for this handling is there seem to be some disturbances connected to the measurements in the top of the mast (30 m above the ground).

The other meteorological parameters are checked to be inside reasonable intervals. The original data which is replaced due to the specified criterions are saved for an assessment. Appendix 2 gives a listing of these records.

- . Plots of the time series are generated and examined.
- . Un physical values (spikes) are eliminated.
- . Final plots of the time series are generated.  
For wind speed and wind direction 10 min values are plotted. For the parameters air temperature (T), humidity (UU) and air pressure reduced to mean sea level (QFF), hourly means are plotted. The hourly mean for 11.00<sup>h</sup> is defined by the measurements for 10.30<sup>h</sup>, 10.40<sup>h</sup>, 10.50<sup>h</sup>, 11.00<sup>h</sup>, 11.10<sup>h</sup> and 11.20<sup>h</sup>.
- . Distribution tables wind speed /direction are generated. 22.5° intervals are applied for the direction. N='348.76° - 11.25°, NNE = '11.26 - 33.75' ...
- . Wind roses are generated.
- . Coefficient transfert tables are generated.
- . Duration table are generated.
- . Climatological summary table are updated.
- . Preliminary estimates for 10/100 year values for the wind are computed.

Logging each 10 minute

## OTHER METEOROLOGICAL DATA

<u>Parameter</u>	<u>Height</u>	<u>Cover.</u>	<u>Unit</u>	<u>Mean</u>	<u>Max</u>	<u>D.:hour</u>	<u>Min</u>	<u>D.:hour</u>	
Air Temp.	2. m <sup>3</sup>	98.6 %	C	15.8	3.2	26.4	31:1104	8.7	01:0414
Rel. Hum.	2. m <sup>3</sup>	98.6 %	%	72	13.5	91	02:0604	25	24:1804
Air pr.	0. m <sup>3</sup>	98.6 %	hPa	1019.3	3.3	1026.4	01:1054	1010.8	26:1454

- 1 Direction is referenced to True North (accuracy  $\pm 2^\circ$ )
- 2 Direction of gust wind is not measured. The mean wind direction for the ten minute period when it has occurred is applied.
- 3 Air temperature sensor and humidity sensor are placed in the mast 2 m above the reference point on the ground while the pressure sensor have the same height as the reference.

The reference point on the ground is located 15.64 m above the mean sea level (NGO).

The time for the logging this month is not 00,10,20,30... as should be the case. In the beginning of the month the logging is made 04,14,24.. Later in the month the logging is made 09,19,29 ... giving some problems to the computing of the hourly means strictly after the definition given.

Due to the burning of waste materials near the measuring mast, unphysical values/variations are encountered in the data. Obvious spikes have been removed from the data and replaced by a missing value notation.

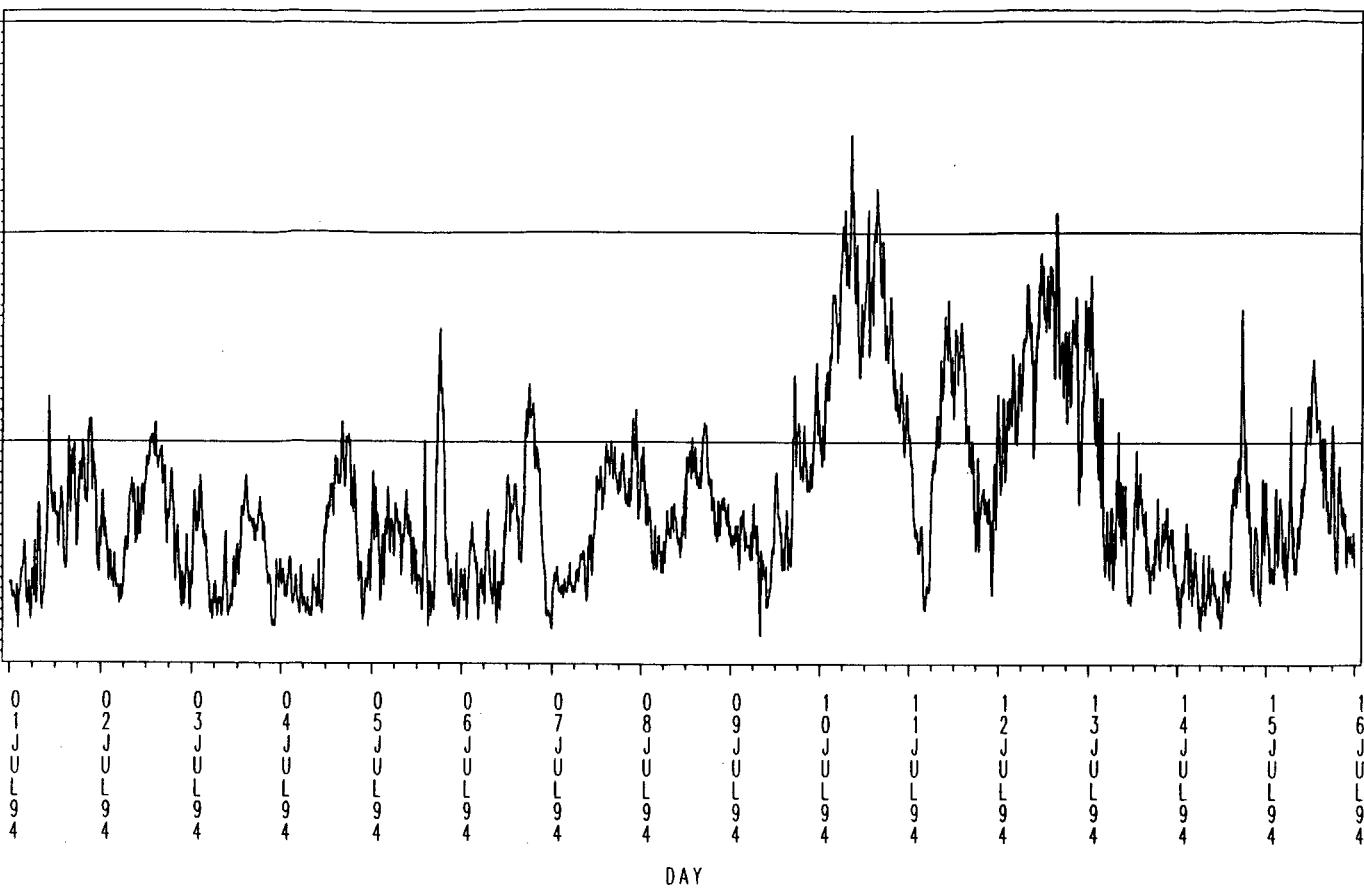

However, the false heating is a random variabel leaving questions to the reliability of the measured air temperature and relative humidity. The actual air temperature is used in the algorithm to compute the air pressure at sea level.

The minimum of the wind speed (0.4 m/s) has occurred several times this month. It is the first occurrence which is given in the table.

## DISTRIBUTION TABLES / WIND ROSES

The distribution table gives details about the distribution of the wind speed for a certain wind direction or the distribution of the wind directions for a certain wind speed.

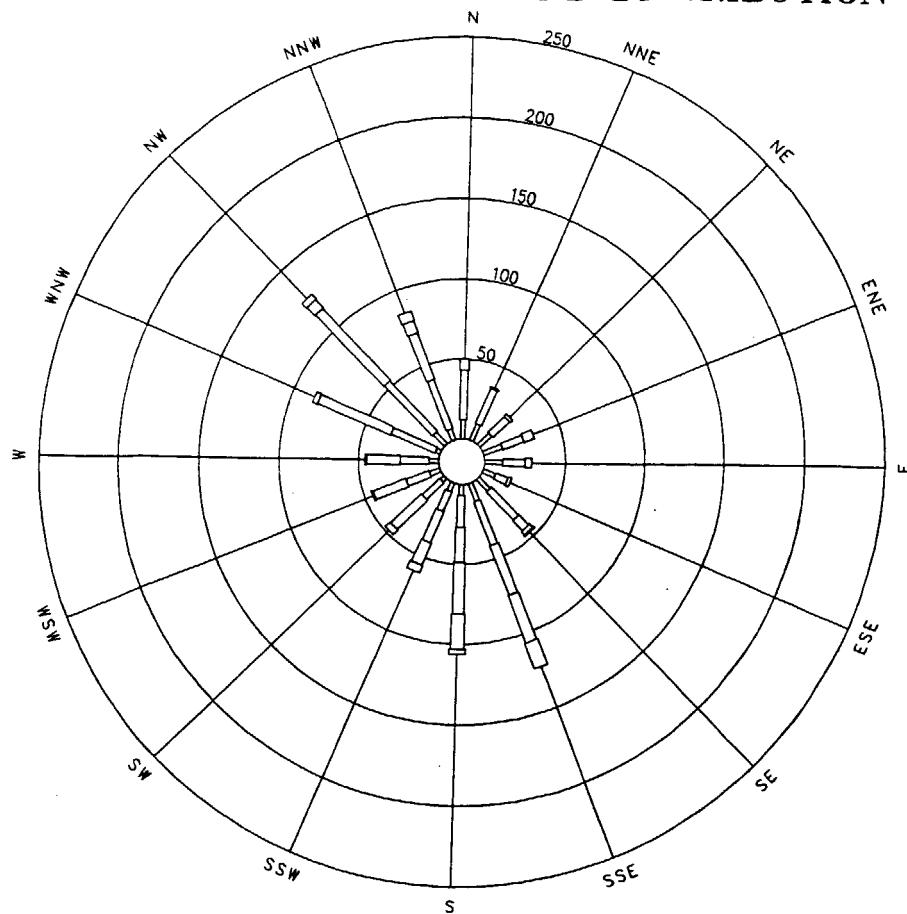

If for example, it is of interest to know the directions for which wind force 5 Beaufort have occurred this month, one has to look at the line for 5 Beaufort in the table.

If the information of the wind forces that have occurred this month for a certain direction is of interest, one has to look at the column for that specific direction.

The frequencies in the table are given per thousand (Prm) of the data available this month.

The wind rose is a graphic representation of the information given in the distribution table. The same number of classes is applied. No Beaufort value is given to the centre of the wind rose. Thus, the first class outside the centre is 0 Beaufort (0-0.2 m/s). Due to the calibration of the wind sensors, this class will always be empty at Hanøytangen.

## COEFFICIENT TRANSFERT TABLES

The tables are actually histograms of the quotient given in the heading of the tables, plotted horizontally. They give details about the distribution of the quotients.

The class interval is 0.5 and the frequencies for the actual class is plotted at the midpoint of the class. If the quotient is 1 the wind speed in the two heights considered have the same value.

The classes start at 0.75 (.725-.774) and end at 1.80 (1.775-1.825). Quotients below or above these limits are counted in these classes respectively.

The tables are giving the frequencies in the actual classes in percent and also as cumulative frequencies in percent.

F30 = Wind speed 30 m above the ground

F18 = Wind speed 18 m above the ground

F10 = Wind speed 10 m above the ground

**PAC 004 WEATHER ANALYSIS IN HANØYTANGEN**  
**REPORT 9 : September 2 1994**

## OCCURRENCE TABLES

The content of the table is based on the hourly maxima ( $F_x$ ) of the 10 min wind speed. First a period fulfilling the criterion  $F_x < \text{Limit}$  is sought. The length of this period is divided by the length of the windows specified and may result in multiples of the actual window or zero if the length of the period is less than the length of the actual window. This procedure is repeated through the month and the number of the different windows are accumulated.

Observation Period :									Location :

Remarks : Based on maximum 10mn wind speed within the interval period, in any direction, at 10 metres level									

## **CLIMATOLOGICAL SUMMARY**

## ESTIMATES OF WIND SPEED WITH 10/100 YEAR RETURN PERIODS

The method for the estimation is described in the report 43/92 KLIMA, Climatological statistics for Hanøytangen near Bergen. The long data series from Hellisøy is the basis for the computations of 10/100 year values.

At Hellisøy the automatic weather station was out of operation regarding all parameters by the end of 1993. The wind speed measurements were functioning again from 3.2.1994. It must be emphasized that when May 1994 was specified as the first month of which 10/100 years should be presented for Hanøytangen, the starting of the parallel series was assumed to be September 1993.

At the end of July 1994 the parallel series between Hellisøy and Hanøytangen, which is the basis for establishing 10/100 year values valid for Hanøytangen, is still very short. It covers the period 3.2-31.7.1994 with some gaps due to missing data at Hanøytangen. The values given below must therefore still be regarded as approximations.

Detailed discussion of the results must be postponed to a longer parallel series is available. However, the transfer coefficient for the direction where the extreme most probably will occur, is of the same magnitude as that used for the 10 min mean in the report 43/92 KLIMA. This preliminary result gives no reason to change the 10/100 years estimates given in this report.

The transfer coefficients for the gust wind is lower than the estimates used in the report 43/92 KLIMA. Thus the estimates for the gust wind in this report may seem to high.

*Estimates of transfer coefficients based on data from Hellisøy (He) and Hanøytangen (Ha) for the period 3.2-31.7.1994.*

$V(\text{Han.}, 10 \text{ min})/V(\text{He.}, 10 \text{ min})$							
$V(\text{Han.}, 3 \text{ sec.})/V(\text{He.}, 10 \text{ min})$							
030-129°	130-159°	160-199°	200-229°	230-299°	300-339°	340-029°	
0.60 0.93	0.72 0.98	0.71 1.00	0.81 1.12	0.65 1.00	0.67 1.00	0.58 0.86	

The estimates for the wind speed at Hellisøy given below and these new transfer coefficients are applied to compute the wind speed estimates for Hanøytangen.

*Estimates of extreme values for the 10 min mean of the wind speed ( $V_{10}$ ) with return periods 10 and 100 years valid for Hellisøy Fyr.*

DIRECTION	SUMMER		WINTER
